## How does a Queue compare to a Topic

1-2 minutos

FAQ > JMS > How does a Queue compare to a Topic

## **Topics**

In JMS a Topic implements *publish and subscribe* semantics. When you publish a message it goes to all the subscribers who are interested - so zero to many subscribers will receive a copy of the message. Only subscribers who had an active subscription at the time the broker receives the message will get a copy of the message.

## **Queues**

A JMS Queue implements *load balancer* semantics. A single message will be received by exactly one consumer. If there are no consumers available at the time the message is sent it will be kept until a consumer is available that can process the message. If a consumer receives a message and does not acknowledge it before closing then the message will be redelivered to another consumer. A queue can have many consumers with messages *load balanced* across the available consumers.

So Queues implement a reliable load balancer in JMS.
